sextotch@oregonstate.edu | (219) 771-3096 | [\[GitHub\]](#) | [\[LinkedIn\]](#)

Education

Oregon State University

Bachelor of Science in Computer Science (GPA: 3.8/4.0)

- **Coursework:** Data Structures and Algorithms, Data Science, Object Oriented Programming

Corvallis, OR

Jan. 2023 – Jun. 2027

Purdue University

Bachelor of Science in Civil Engineering (GPA: 3.4/4.0)

West Lafayette, IN

Grad. May 2022

Technical Skills

Languages: Python, Java, C, SQL, JavaScript

Backend and Cloud: Node.js, Express.js, Spring, Flask, Redis, MongoDB, MySQL, Grafana, Prometheus, Honeycomb, AWS

Frontend: React.js, HTML, CSS

Developer Tools/Concepts: Git, Jenkins, Docker, Jira, Confluence, Unit Testing (Pytest, Mockito)

Experience

Software Engineer Intern

SailPoint

Austin, TX

Jun. 2026 – Present

- Returning backend software engineering intern developing an LLM agent that analyzes PRDs, generates and executes tests, and sends notifications to the team using Python and GitHub integrations.

Software Engineer Co-op

Curriculum Associates

Boston, MA

Jan. 2026 – Jun. 2026

- Shipped a student progress tracking REST API as a microservice in Java/Spring for 1 million users nationally and migrated deprecated AWS S3 storage (across ~6,000 lines of legacy code), reducing coupling across service layers.
- Developed an educator setting for up to 130 school districts in Java/Spring and Liquibase/MySQL that allows educators control whether third party external assessment data is utilized for student diagnostic and added UI updates in TypeScript.
- Built an internal student placement tool in React.js/TypeScript that visualizes how students are placed in their designated grade, so teams can visually validate and debug grade placement.

Teaching Assistant

Oregon State University

Corvallis, OR

Sept. 2025 – Dec. 2025

- Led 40 students in object-oriented programming through one-on-one office hours, debugging student code, and grading, resulting in a group of 5-10 students actively seeking mentorship throughout the duration of the course.

Software Engineer Intern

SailPoint

Austin, TX

Jun. 2025 – Aug. 2025

- Developed a MVP using Grafana to track & visualize new feature flag error spikes from 550+ million data points throughout each risk region (low, medium, high), resulting in a 50% reduction of debugging/monitoring time for the on-call engineers.
- Pinpointed failing error spikes to their feature flag by using Honeycomb, Prometheus, and LaunchDarkly API data into Grafana to provide on-call engineers failing HTML endpoints, cutting research time down from minutes to seconds.
- Built a PagerDuty alert service that notifies on-call engineers of suspicious feature flag errors across 15 AWS regions.

Civil and Project Engineer – (automation project as an engineer)

HNTB and Alberici Constructors

Indianapolis, IN

Jun. 2022 – Mar. 2025

- Sole developer of a Python/VBA tool that automatically creates construction cost summary sheets by using the engineering documentation, then outputting formatted and correctly populated PDFs, cutting task time by 83% for 25+ engineers.
- Built BeautifulSoup web scrapers to pull links and state pricing data, saving 2 hours per project across 20+ bridge projects annually by spell-checking, fixing formatting, and retrieving recent price updates from the Department of Transportation.
- Developed a scalable architecture by centralizing all files on the company's network server, allowing for efficient version control and multi-user access across the company.

Projects

AI Nutrition Tracker | [\[GitHub\]](#) | *Python, SQL, HTML, CSS, Flask, Redis, Docker, OpenAI, Matplotlib, PyTest, Git*

- Built a microservices-based Flask application for calorie and weight tracking with integrated OpenAI meal logging that removes manual entry time by automatically calculating calories.
- Integrated OAuth 2.0 authentication with Auth0 identity service and Redis session caching for secure, low-latency login.
- Developed a chart to track a user's calories over time by incorporating a SQL database and using Python's Matplotlib to visualize in the frontend using Flask/HTML/CSS.

Boardgame Database Tracker | [\[GitHub\]](#) | *JavaScript, HTML, CSS, SQL, MariaDB, Node.js, Handlebars*

- Built a full-stack inventory management web application to track board game inventory using Node.js and MariaDB.
- Designed a modular relational schema and implemented stored procedures to improve data integrity and query performance.
